ID NUMBER:01025033192

SEMESTER 4

DEPARTMENT: SOFTWARE ENGINEERING

1.PROJECT TITLE: EVENT MANAGEMENT SYSTEM

2. INTRODUCTION

Organizing events in schools, universities, or organizations often involves multiple challenges, including manual registration, poor communication, and difficulty tracking attendees. Traditional event management methods are time-consuming and prone to errors.

The Event Management System (EMS) is a web-based application designed to automate the planning, registration, and management of events. It provides a centralized platform for organizers and participants, improving efficiency and reliability.

3. PROBLEM STATEMENT

Manual event management systems have several drawbacks:

Errors in registration and data duplication

Difficulty tracking participants and attendance

Poor dissemination of event details

Time-consuming planning and coordination

Inadequate record-keeping and reporting

These problems reduce efficiency, lead to participant frustration, and make event management cumbersome.

4. AIM OF THE PROJECT

To develop an automated system that simplifies event planning, registration, and tracking for both organizers and participants.

5. OBJECTIVES

Develop a user-friendly platform for creating and managing events

Enable participants to register online easily

Provide real-time notifications and updates

Maintain an organized database of events and participants

Improve communication between organizers and attendees

6. SCOPE OF THE SYSTEM

The Event Management System will:

Allow users to register, log in, and view events

Enable online registration for events

Allow administrators to create, edit, and delete events

Provide notifications and reminders

Limitations:

Internet access is required

Initially web-based only (mobile version can be added later)

7. SIGNIFICANCE OF THE STUDY

Reduces manual workload and errors

Improves communication between organizers and participants

Enhances efficiency in planning and managing events

Provides organized records for reporting and future reference

8. SYSTEM ANALYSIS

Existing System

Paper-based registration forms

No centralized system

Manual tracking of participants and event details

Proposed System

Fully digital platform

Centralized database

Automated notifications and attendance tracking

9.TOOLS AND TECHNOLOGIES

Frontend: React.js or HTML5, CSS3, JavaScript (for dynamic and responsive interface)

Backend: Node.js with Express.js or Python Django/Flask (for server-side logic and APIs)

Database: MySQL or PostgreSQL (for structured data storage)

Version Control: Git and GitHub (for source code management)

Testing Tools: Jest or PyTest (for unit and integration testing)

Deployment/Hosting: Heroku, AWS, or DigitalOcean (for making the system accessible online)

Additional Libraries: Bootstrap or Tailwind CSS (for UI styling), Axios or Fetch API (for frontend-backend communication)

10. METHODOLOGIES

The project will follow the Agile Software Development Life Cycle (SDLC):

Planning: Topic selection, feasibility study, project objectives

Analysis: Requirements gathering and study of existing systems

Design: System architecture, database design, UI design

Development: Frontend, backend, database integration

Testing: Unit, integration, and system testing

Deployment: Making the system accessible to users

Maintenance: Updates and system improvements

11. WORK PLAN AND TIMELINE

The project will be completed in phases based on the SDLC.

Phase

Tasks

Duration

Planning

Topic selection, problem identification, feasibility study

1 week

Analysis

Requirements gathering, functional and non-functional specification

1 week

Design

System architecture, database schema, UML diagrams, UI design

2 weeks

Development

Frontend and backend implementation, database integration

3 weeks

Testing

Unit testing, integration testing, system debugging

1 week

Deployment

System deployment, user training, documentation

1 week

Maintenance

Future updates and bug fixing

Ongoing

Deliverables Per Phase:

Planning 'n Project proposal

Analysis 'n Requirement specification document

Design 'n UML diagrams, database design, UI mockups

Development 'n Fully functional Event Management System

Testing 'n Test reports, bug fixes

Deployment 'n Deployed system with user manual

Maintenance 'n System updates and improvement logs

12. EXPECTED RESULTS

Efficient event management system

Reduced registration errors

Improved communication with participants

Organized event records for reporting

Time-saving and better user experience

13. FUTURE ENHANCEMENT

Mobile application version

Payment gateway integration for ticketed events

QR code-based event entry verification

AI-based event recommendations for users
